Funerary Iconography on an Infant Burial Jar from Ashkelon*

KATHLEEN BIRNEY
Harvard Semitic Museum

BRIAN R. DOAK
George Fox University

ABSTRACT: The 2007 season of the Leon Levy Expedition to Ashkelon unearthed a remarkable intramural infant jar burial, bearing roughly incised images on both sides. While a number of intramural infant burials have been recovered from late twelfth–eleventh century levels at the site, this jar is the first burial to reveal anything about the funerary beliefs and rituals that might be associated with such practices. The iconography itself is unique within the Philistine milieu, as well as within the broader context of Syro-Palestinian funerary imagery, instead echoing Egyptian funerary motifs. After a brief discussion of the jar and its archaeological context we offer an interpretation of the burial jar’s iconography and explore its possible relationship to Egyptian funerary ritual.

THIRTY years of excavations within the Philistine Pentapolis have allowed us tremendous insight into the material culture, history and religious practices of the immigrant Sea Peoples. Nevertheless, we have little understanding of how the Philistines approached death and the ritual of burial. Iron I–II burials connected with Sea Peoples have been so attributed on the basis of essentially circumstantial evidence, their ethnicity assigned according to small amounts of Philistine-style pottery, presumed ‘regional’ connections with Sea Peoples, or limited evidence of potential Aegean influence.¹ No cemeteries have been excavated which can conclusively be associated with either the Philistine Pentapolis sites or any other Sea Peoples’ settlement.²

Recent excavations at Ashkelon, however, may finally allow us a small

² Maeir’s suggestion (2007) that the cave tombs in Area T of Tell eš-Šaﬁ (possibly biblical Gath) represent clearly Philistine burials cannot yet be confirmed, although we look forward to their full publication.
glimpse into some of the local burial customs in the Pentapolis itself. Some 11 intramural infant burials in pits and jars were uncovered in residential contexts in Grid 38 during the 1998–2005 seasons. The burials span Iron I Phases 20a through 18b, with the majority occurring in later Phase 19 and early Phase 18, a period dating to roughly the late twelfth to the mid-eleventh centuries. Similar intramural infant burials have been attested, though not yet fully published, in contemporary levels at the Philistine site of Tel Miqne-Ekron (Mazow 2005: 449–452; Gitin, Meehl and Dothan 2006: 59). These intramural infant burials are therefore the first examples we have of Iron Age burials appearing in undisputed association with Philistine settlements.

INTRAMURAL BURIALS

The Ashkelon infants were buried under the floors in rooms throughout the residential quarter in Grid 38. They were placed either in corners or near doorways, always along walls, rather than in the centre of the room (fig. 1). They seem to have been set mainly in high-traffic common areas, where household tasks and industrial activities were carried out, rather than being tossed out of the way in storage closets, or alternatively, brought into the innermost living spaces. Their deliberate placement may thus reflect a type of liminality, in that the burials occur in rooms where, from a social and functional perspective, the transition from the public to the private domain takes place (Mazow 2005: 451). None of the burials occur in outdoor spaces: they are altogether absent from alleys and streets.

The burials themselves are of two types: either simple pit interments or jar burials. Where jars were employed, the neck of the jar was broken off, likely to facilitate placement of the body; in at least one case, a stone was set over the break, perhaps to seal the jar after interment. Several of the burials — whether pit or jar — seem to have been marked, either with a ring of larger stones, or with a scattering of small stones and/or pithos sherds. The infants themselves are not uniformly oriented — the heads point in all directions — nor is there any clear pattern of the positioning of the infants within the graves. Those which were discovered intact seem to have been slightly flexed or set on their backs. All appear to be quite young: initial osteological analysis of the skeletons suggests that none were more than a few months old and most were, in fact, two months of age or younger. Grave goods were rare or absent — although beads and shells

---

3 We present here only a brief overview of the Ashkelon infant burials and their parallels; full analysis and publication of the Ashkelon burials, along with a study of comparable practices, will appear in a forthcoming work by Stager et al.

4 A review of the available information suggests that all of the Ekron burials also seem to have been positioned in corners and alongside walls and in similarly transitional contexts; Gitin, Meehl and Dothan 2006: 54–55.
were occasionally found nearby, it is unclear whether they were intended as grave offerings or simply abandoned in the fill layers surrounding the burials.

The widespread popularity of intramural burial for infants and children makes it difficult to trace a clear path for the transmission of the custom, if indeed there is one to be traced. As a general practice, intramural burial of infants and children is widely attested throughout the Mediterranean, from the Balkans to Egypt. Within

Fig. 1. Ashkelon residential quarter, Grid 38, Phase 18; location of inscribed jar burial indicated (after Aja 2009)
the Levant, intramural burial was common throughout the Neolithic and Chalcolithic periods, although in no period was intramural the sole — or even the statistically preferred — burial type. The practice continued in low frequency in the Early Bronze Age, experienced resurgence in the Middle Bronze Age, and died out in the Late Bronze Age I (Ilan 1997).5 However, the Levantine burials differ from our Pentapolis examples in that they are not limited exclusively to children but span a range of ages, and in that they frequently include multiple individuals within a single grave. Although technically ‘intramural’, these early burials occur in a variety of both domestic and semi-public spaces, both in interior rooms and in courtyards. The Levantine practice also differs from the Ashkelon intramural infants in the regular inclusion of ceramic grave offerings, typically juglets, even for the very young.6 Thus, while there is precedent for intramural burial of infants in Canaan prior to the Philistine settlement, these differences give us pause in arguing that the Pentapolis burials are simply the resurgence of an older, Canaanite, tradition — popular again after nearly 300 years.7

Infant subfloor burial was also practiced in Egypt, attested from at least the Middle Kingdom through the 19th–20th Dynasties and possibly earlier (though such burials are, lamentably, poorly published, if at all).8 From the little available data it seems that the individuals — infants and children up to three or four years of age — were all buried in domestic spaces. They were deposited chiefly in pots, though some were interred in wooden chests or simple pits (Picardo 2006: 40; Janot 2001–02; Dunand 2004). In all, however, the existence of dedicated infant cemeteries at Deir el-Medina and Gurob throughout the New Kingdom and Ramesside periods suggests that intramural burial was the exception, rather than the rule, during the thirteenth–twelfth centuries (Bruyère 1937: 161–164; Meskell 1994; 2002: 81–83; Janot 2003).

The most numerous and chronologically immediate predecessors to the Pentapolis burials appear in Greece, where infant subfloor burials are attested at

---

5 Intramural burials are attested in MB–LB I levels at Megiddo, Hazor, Tell el-ʿAjjul, Tel Dan, Tel Dothan, Jericho, Tel Miqne-Ekron, Tell el-Farʿah (N) and Beth Shean. Jar burial of both adults and children persists in the Iron Age, but such burials appear only in extramural contexts or dedicated cemeteries (Gonen 1992: 15–21; Bloch-Smith 1992: 31–32, 160–164, 220).

6 The only exception to this rule in Philistia is a pit burial set at the threshold of the entrance to Building 350 (Str. VC) at Tel Miqne-Ekron, which was unusual in being the only burial with ceramic grave goods — a small juglet — and a nearby store jar base filled with ash and small bones (Mazow 2005: 450). These elements suggest an affinity with Canaanite LB burial customs.

over 15 mainland sites throughout the Late Helladic period (Polychronakou-Sgouritsa 1987). Several examples also occur at Knossos and Khania on Crete during the Late Minoan II–III, in houses that display Mycenaeanising cultural traits (Warren 1982–83: 63, 73, 80). There are similarities between the Aegean and Pentapolis burials in the specifics of the practice as well: in the use of stones to ring or line the burials and in the marking of the graves with a scattering of stones or pithos sherds (Polychronakou-Sgouritsa 1987: 19–20). Such features seem to be absent from Levantine and Egyptian burials. It may also be significant that although not the sole burial practice, intramural burial appears to have continued as the generally preferred rite for infants and children in mainland Greece throughout the following Submycenaean and Geometric periods until roughly the eighth century BCE (Popham and Musgrave 1991; Nicholls 1958: 126; Sourvinou-Inwood 1983: 45).

THE RECENTLY DISCOVERED ASHKELON BURIAL JAR

The most intriguing of the group of Ashkelon infant burials was excavated during the 2007 season, in the anteroom of an Iron I house of Phase 18 (eleventh century BCE) on the east side of Grid 38 (Square 75, Layer 375; see fig. 1). The burial pit was dug in the corner of the room, next to a mudbrick bin, and was ringed with large stones and potsherds (fig. 2). Unlike the other Ashkelon jar burials where Levantine jars were employed, this infant was placed in an Egyptian storage jar, which was broken off at the rim and across the base. The jar itself was roughly

Fig. 2. Infant burial jar in situ (photograph by B. Doak)
carved with an image on each side. The child within, somewhat larger than the other infants, was buried face up, legs protruding from the bottom of the container from the knees down. Its sex is unknown. Its size suggests that it was older than most of the other infants recovered from the site, perhaps closer to four months of age (fig. 3). This infant is therefore unique on several counts, differing from the
other intramural burials in the choice of container and the age of the child at death, as well as in the associated iconography. No grave goods appeared with the body.

The precise classification of the burial amphora is difficult to determine as both neck and base have been broken off to accommodate the body. Such difficulties notwithstanding, the jar seems most comfortable within Aston’s categories of Egyptian Marl D amphorae Types B2 or B3, which are transitional Late Bronze–Iron Age derivatives of the traditional New Kingdom B1 wine amphorae. The slightly ‘baggier’ base on the Ashkelon jar tilts the balance slightly in favour of the later B3 form, although its width would not necessarily preclude the carination typical of the B2 base (Aston 2004: 193, fig. 8). The ware of the Ashkelon jar, greyish-brown with a rosier core, is covered with a greenish-cream slip, and the jar also shows some faint signs of crude vertical burnishing. Both the clay and the surface treatment of the Ashkelon jar are thus consistent with Aston’s characterization of typical Marl D H1 fabric in which the B1–B3 amphora forms were often manufactured, although B2 and B3 amphorae were known to exhibit a number of variations (Aston 2004: 185).

The B2 amphora was common from the time of Ramesses II until the end of the 19th Dynasty, after which it was supplanted by the B3 form, which persisted to the end of the 20th Dynasty, perhaps into the reign of Ramesses XI (Aston 2004: 193). Depending, therefore, upon the precise classification of the form, the Ashkelon jar could be dated anywhere from the mid-thirteenth to the late eleventh century. It is possible that the jar might originally have been a Late Bronze import to the site — Egyptian pottery, after all, constituted nearly 30% of the LB II (Phase 21) assemblage at Ashkelon (Martin 2009: 298) — and was preserved as a kind of ‘heirloom’ for use by subsequent generations. However, the wide-bodied B3 form is otherwise unattested in LB II levels at the site. It is instead known from Iron Age I horizons at Beth Shean (Martin 2004: 273–274), as well as several Negev sites (E. Oren: personal communication), and the B3 form is likewise known to have circulated at least as widely as Cyprus in the twelfth century BCE (Eriksson 1995: 201). The jar is therefore potentially contemporary with the burial, and though it may be considered unusual for the early Iron Age, it is by no means unique outside of Egypt.

THE ICONOGRAPHY

The burial jar bears carvings on both sides: a smaller image (hereafter: ‘side A’) on the shoulder of the jar between the handles and a second image (hereafter: ‘side B’) carved over a larger area stretching from the handle zone down the side of the body. The markings on side A of the jar represent some kind of animal with ears protruding from the top of the head, an elongated tail, and a deliberately carved set of legs extending from the front of the animal (fig. 4). Although partially obscured by breaks in the jar, a second set of legs can be seen to protrude from the rear of the
animal (Birney and Doak 2008). While the shape of the head and the curvature of the body is initially suggestive of the Egyptian horned viper, the reconstruction of four legs, its sloping tail and distinctive upright ‘ears’ clearly mark the creature as some type of canid. Crudely represented, the image is probably a jackal *passant* (walking) in the style of Egyptian jackal divinities, such as Anubis, or of the lesser known figures, such as Upwawet, Sed (Brovarski 1984: 779), or Khentyamentiu (who might be an early form of Anubis), among others (see Wilkinson 2003: 186–192; DuQuesne 2005b; 2007a: 17–21).

The most striking formal parallels to the jackal figure on side A occur on a group of nearly 600 incised limestone grave stelae from the private tomb of
Djefaihapy at Asyut, dubbed the ‘Salakhana trove’ (DuQuesne 2007a). The tomb from which they were recovered — the largest known private tomb in Egypt — belonged to Djefaihapy III, a 12th-Dynasty nomarch of Lycopolis, of which Asyut was the capital. Although the tomb itself dates from the Middle Kingdom, the majority of the stelae within are dated to the 18th and 19th Dynasties, albeit with a few later examples (DuQuesne 2007a: 24).

Nearly all of the stelae were private votive offerings to jackal deities (Lacau 1922; DuQuesne 2000: 6–12; 2007b: 461–463). Most represent the dedicant, an offering table of some sort, and a representation of either the recipient in the form of a jackal-headed human, or a jackal riding on a standard (this last element is typically rendered as a sledge on a staff, adorned with uraeus and/or shedshed). On many of the stelae, the ‘main’ deity — whether anthropomorphic or theriomorphic — is attended by more than a dozen smaller passant jackals, similar in shape but slightly smaller in size relative to the ‘main’ jackal (whether standing or riding atop a standard; fig. 5).

The two most prominent Egyptian jackal deities, Anubis and Upwawet, are so similar in their roles and iconography that it is at times difficult to distinguish them by their depictions alone. Anubis, a funerary deity whose primary role was as embalmer to the dead (Altenmüller 1975: 327–333; Corteggiani 2007: 42–45; Wilkinson 2003: 186–190; Doxey 2002: 21–22) or psychopomp (DuQuesne 1995), could be represented either as a human with a jackal head or as a jackal with no human features, the former being the convention in most free-standing three-dimensional images. When theriomorphic, Anubis was typically depicted as a jackal couchant (lying down with raised head). By contrast, Upwawet is most often depicted in fully canid form, as a jackal passant, although there are few instances in which he appears anthropomorphised with a jackal head, as Anubis. While these artistic conventions could be used to guide the viewer in identifying the appropriate god, it has been suggested that at times such images may have been intentionally ambiguous so as to serve double-duty for the cults of both gods, both of whom could function as psychopomps and both of whom were significant in Asyut (DuQuesne 1995: 41–42; 2002: 11). Fortunately, the dedicants of the Salakhana stelae have come to our aid in distinguishing between the jackal deities.

---

9. Less than 5% of the collection were devoted to other gods, including Sobek, Taweret, Amen-Re, Osiris and Re-Horakhti. Stelae dedicated to the latter were the latest, attributed to the 25th–27th Dynasties, although, due to poor publication, their inclusion in the overall corpus may be spurious (DuQuesne 2007a: 28).

10. See DuQuesne 2007a: 44, CM018; 45, CM380; 47, CM025; 48, CM031; 52, CM464, and many other examples. Note that these jackals are drawn quite differently from hunting dogs, which appear represented in packs on a handful of First Intermediate Period stelae from Naqada (Fischer 1964: nos. 27–60, pls. XXIV, XXXII–XXXIV).

11. For an example of Upwawet, see Roehrig and Hill 1992: 50, fig. 50; DuQuesne 2007a: 38–39, A08–9.
Fig. 5. Private burial stele from Salakhana, Asyut CM025 (DuQuesne 2007a: 47)
to whom they were appealing. Although a number of the stelae invoke and represent Anubis, the majority of the inscriptions and dedicatory notes identify the primary recipient of these devotions as the god Upwawet of Upper Egypt, Controller of the Two Lands (\textit{Wp-w\textasciitilde{3}wt \textasciitilde{3}m\textasciitilde{3}w Qb\textasciitilde{3}-t\textasciitilde{3}wy}). And indeed, the presence of Upwawet’s worship in this particular locale is unsurprising as he was the tutelary god of Asyut (Spiegel 1973: 32–35). The tomb of Djefaihapy seems to have been reused — in apparently unprecedented fashion — as the shrine for personal devotions, an attendant cult centre, and place of pilgrimage for Upwawet (so DuQuesne 2000: 18; 2007a: 30).\textsuperscript{12}

The Salakhana stelae thus offer unique insight into ‘popular’ or ‘personal’ religion, as opposed to grandiose state expressions (Sadek 1987: 40–42; DuQuesne 2007a: 27–30). Few of the dedicants indicate any royal connection; instead, the range of professions represented by the donors includes male and female cultic officials, members of the military, boatmen, washermen and butchers. An unusually high proportion of the donors seems to be women, and family groupings are also represented (DuQuesne 2000: 15; 2002: 11; 2005a: 44). The iconography is likewise a mixture of canonical and non-canonical: evidence for local and personal variation is extensive, and depictions range from the refined images of (presumably) wealthy worshippers\textsuperscript{13} to simple and sometimes awkward depictions of the invoked deity.\textsuperscript{14} Despite the variation exhibited there, the image of Upwawet on the Ashkelon jar would hardly be out of place among the representations on these stelae from Asyut; indeed, the position of the upright ears and the general curvature of the body on the Ashkelon jar suggest a close formal affinity with the Asyut examples.

Upwawet’s funerary role is similar to that of Anubis, in that (according to royal funerary inscriptions) the king is required to transform into Upwawet in order to complete the process of resurrection. His role as an agent of rebirth is underscored in Pyramid Text 113, which proclaims that ‘Upwawet has made me fly to the sky’.\textsuperscript{15} Nor does this process appear to have been limited exclusively to the royal elite: the dedicant of Salakhana stele CM040, a woman, Nefer-ronpet, recorded the following hymn of praise for Upwawet: ‘I have made your \textit{ka} content every day. I have brought to birth the jackal as a god’, which employs similar imagery of rebirth.\textsuperscript{16} Upwawet’s particular temenos, however, seems to be a celestial one, in part due to an overlap between his role as protecting jackal and that of Horus in his

\textsuperscript{12} According to the original report, the tomb also contained several mummified jackal burials, though these artefacts are now lost (Beinlich 1975: 493; DuQuesne 2000: 9).

\textsuperscript{13} E.g., DuQuesne 2007a: 43, CM165, 358; 44, CM018.

\textsuperscript{14} DuQuesne 2005b: figs. 13, 14; DuQuesne 2007a: 71, CM184; 73, CM186, 395, 313.

\textsuperscript{15} PT # 13 Spell 302, cited in DuQuesne 2005b: 300.

\textsuperscript{16} DuQuesne (2005b: 47) suggests that the reference to bringing ‘to birth the jackal as a god’ pertains to some act of offering a cult image or processional arrangement, or else that the statement is an idiomatic expression of thanksgiving.
role as avenger of Osiris. Thus, the image may be intended to invoke Upwawet in both his protective and his resurrective capacities. Alternatively, the jackal might represent Upwawet in his role as psychopomp, guiding the soul of the innocent in death.

The exact status and nature of the attendant jackals on the Salakhana stelae are unclear. It has been suggested that they may represent separate manifestations of the deity, additional beneficiaries of the offering, or animals fattened for sacrifice to Upwawet (Durisch 1993: 217–288). According to DuQuesne, this repetitive arrangement emphasises that each jackal image relates ‘closely to the deity, being probably regarded as b3-forms, in other words hypostases, earthly types, or manifestations of Upwawet and/or Anubis’ (DuQuesne 2000: 20). One particular representation contains several rows of jackals facing one another, with the name Wp-w3wt inscribed between each row. However, while it is typical on the Salakhana stelae for both a central figure on a standard and attendants to be represented, there are quite a few examples upon which only a single deity appears (e.g., CM035 and CM030, DuQuesne 2007a: 47, 52), as on the Ashkelon jar.

The iconography on side B of the Ashkelon jar is somewhat more enigmatic (fig. 6). Unlike the jackal, which is set at the shoulder of the jar, the figure on the reverse spans the extant length of the jar, stretching from the shoulder down almost to the broken base. Although the identification of the image is uncertain, it is important to note the proportions of the jackal vis-à-vis this other, much larger, image on side B (see below, fig. 8). Bearing this in mind, we offer here two possible interpretations of the side B image: as a divine standard or as an offering table.

Nearly all of the Salakhana stelae...
depict Upwawet in tandem with his divine standard, or ‘carrying-shrine’ (DuQuesne 2004; Graefe 1985: 863). The shape of the Upwawet standards varies widely, and, though there is no exact parallel to our iconography, the general characteristics of the form — the slightly semi-circular body and the upturned edges of the sledge — are similar to the image on side B (fig. 7). The Salakhana artists consistently adhered to some canonical notion of proportion between the jackal and the standard, and we see a similar sense of proportion emphasised on this Ashkelon jar (fig. 8).

In the Egyptian representations, Upwawet’s standard — typically, but not always, adorned with Upwawet’s emblematic shedshed and uraeus — probably represented some sacred procession of the image of the deity (Durisch 1993: 215ff.; DuQuesne 2004: 30ff.; 2007a: 27; Uphill 1965: 370–376), and, although the procession of the jackal god played a prominent role in festivals of royal renewal, individuals of varying social and economic statuses were apparently included in the festivities at various levels (DuQuesne 2003: 26). The presence of the ‘standard’ on the Ashkelon burial jar in question may only be vestigial and

Fig. 7. Standard of Upwawet on Salakhana stelae CM309 (left) and CM184 (DuQuesne 2007a: 23, 71)

19 See DuQuesne 2007a: 43, CM165, CM358, etc.
20 See, e.g., DuQuesne 2007a: 54, CM175; 52, CM030; 47, CM025; Durisch 1993: figs. 5, 7.
need not refer to any actual procession of Upwawet at Ashkelon. Though a significant number of Egyptian examples depict various devotees at worship before the standard, or the cult image in the midst of royal procession with the king, many more examples portray the standard without attendants in a static position, as on our jar. It should be acknowledged, however, that it is unclear why Upwawet should be separated from his standard on our jar, unlike the parallels from Asyut. Perhaps the creator intended to flank the body with protective images on either side of the jar, thus shielding the infant from harm on all sides.

The presence of the two spheres atop the ‘standard’ on the jar is equally difficult to explain with confidence. It may be that the twin discs refer to some understanding of Upwawet’s role as another son of Horus, or perhaps even a reference to the joint and overlapping role of both jackal deities — Anubis and Upwawet — in the guardianship and resurrection of the dead. Along with many other Egyptian deities, Upwawet shared certain solar and celestial affiliations.21 Toward this end, one might refer to an enigmatic funerary scene from Deir el-Bahri (Ritner 1985: 150, fig. 1). Here Anubis is shown leaning over a similar, albeit singular, disc. Ritner suggests that the disc represents the moon and that the

---

21 E.g., DuQuesne 2007a: 28, S12, where a winged sun-disk appears in the lunette at the top of the stele.
object stands in place of the body of Osiris, whom Anubis embalms in preparation for the journey upward into the heavens to achieve his reborn state (1985: 152–154). The discs above the ‘standard’ might therefore represent the body or ‘soul’ of the infant as Osiris, the object of the jackal god’s resurrective intentions.

As an alternative, the image on side B might also be seen simply as a crude version of the conventional offering table holding two bread loaves, imagery that appears not only in association with Upwawet on the Salakhana funerary stelae but in nearly every Egyptian burial context.22 Offering tables can be represented as detailed drawings or crude carvings, the latter especially in private settings, as illustrated by the Salakhana stelae. The less elegant versions are drawn as a simple upright line, representing the base, and a horizontal line, sometimes with slight thickness and upturned edges, as the table top. Food offerings on such tables tend

Fig. 9. Offering tables on Salakhana stelae CM351 (left) and CM455 (right) (DuQuesne 2007a: 54, 48)

22 An observation similarly made by Peter der Manuelian (personal communication, October 2008).
to range from a single hieroglyph for bread (the tabletop and offering mimicking
the hieroglyphs in the $\textit{htp-di-nsw}$ formula) to simple circles drawn or gouged out.
The simple offering tables appearing on Salakhana stelae S20 and S56 provide the
best parallels for our side B image as an offering table (fig. 9). Both are simply
represented and laden with merely a few loaves of bread, signified by the drawn or
gouged circles (DuQuesne 2007a: 54, 75). Such an interpretation similarly takes
into account the intent of the artist in preserving the relative proportions of the
jackal of side A and the table of side B, mirroring the disparity in size between the
$\textit{passant}$ canid figures and the offering tables of the Salakhana stelae.

Whether laden with simple bread loaves or elaborate feasts, funerary offering
tables are understood to bear symbolic nourishment for the dead and/or food
offerings for tutelary deities invoked for safe passage of the deceased. The two
spheres at the top of the side B image might therefore represent two round bread
loaves, a proportionally simple offering for a small person.

**DISCUSSION**

The social significance of burials has been extensively discussed in both archaeo-
logical and anthropological literature, where the rite has been alternately hailed or
decried as an indicator of ethnicity or class, or as a window into religious belief
(Metcalf and Huntington 1991; Chapman 2003; Lorentz 2005). In large part,
disagreements over the relative value of burials as meaningful mirrors of life and
belief in the ancient world hinge on the inherent difficulty of distinguishing
between personal devotion and public expression, as the rite arguably spans both
spheres. This is particularly true of burials carried out in public spaces (cemeter-
ies, tombs, courtyards), where the presence of an audience was possible, if not
actively cultivated, and familial grief was often marked and measured in material
terms.

Intramural infant burials, such as the one discussed here, are a somewhat
different matter. It has frequently been suggested that infants and young children
were not yet of age to be accorded full social ‘personhood’ within the larger
community. Having never fully entered society, therefore, society need not note
their absence, and as such, they were often accorded different post-mortem treat-
Intramural infant burials themselves are certainly less likely to have been publicly
observed, the deceased shielded from public scrutiny as much by their diminutive
social status as by the walls of the private homes in which they were buried. It is
therefore possible that the Ashkelon intramural infant burials might have been
less subject to strategies of social display, and therein would arguably constitute
clearer reflections of personal belief and family expression.

The Pentapolis intramural infant burials are the first Iron Age burials which
can be indisputably linked with a settlement of the Sea Peoples. Against the
backdrop of the markedly Aegean material culture in the Pentapolis cities, the starkly Egyptian iconography on the Ashkelon jar is therefore striking.

It is, of course, possible that the resident of our jar may have been a child born of an Egyptian parent or parents living in Ashkelon, given that intermarriage between the Philistines and Egyptian (or Canaanite) women was always a possibility.23 The presence of Egyptian iconography need not be taken as an indicator of ethnicity, however. At Ashkelon, the occupational phase (Phase 18) in which the majority of intramural burials — including this one — appear is characterised by an increase in both Cypriote and Egyptian cultural traits. Scarabs, Egyptian stamp seals and even religious figurines were recovered throughout the grid during this phase, and do not at present appear to have been confined to a single house. Whether these items reflect the growing availability of exotic trinkets as trading conditions improved in the Iron Age or suggest a small influx of immigrants instead, Egyptian or Egyptianising influence would not have been out of place during Phase 18.24 The selection of the jar too may have been influenced more by its greater storage capacity, better suited to a slightly older child, than by any particular cultural affiliation. The Ashkelon jar thus need not be seen as a departure in substance from the local Pentapolis practice of intramural infant burial, but rather as the enhancement of local ritual through the use of exotic or personally meaningful images.25

It is interesting to note that the one unifying feature of the burials which have been associated with the Sea Peoples, whether northern or southern, seems to be their lack of unifying features — that is, their mixed or ‘international’ character. At Azor, for example, built tombs coexist with jar burials, simple pit burials and cremations throughout the eleventh–ninth centuries BCE (Ben-Shlomo 2008: 51). Aegean and Cypriote customs have long been identified among Canaanite burials at Tell el-‘Ajjul and Tell el-Far‘ah (S).26 While the specific expression of intramural infant burial in the Philistine Pentapolis may be rooted in part in the Aegean world, the iconography on the jar from Ashkelon may stand not as a marker of particularly Philistine customs, but rather as an important emblem of the degree of ethnic diversity prevalent in the Philistine (or Sea Peoples’) cities even from quite early on. This runs counter to early approaches, which treated the Iron I material culture of the Pentapolis as exclusively Aegean, operating within an impermeable cultural ‘membrane’ — a view informed largely by the dichotomy between

23 Cf. Bunimovitz and Yasur-Landau 2002. In this light, it may be significant that such a high proportion of the Asyut stelae involving Wepwawet had female donors.
25 One might view the Canaanite ‘accents’ of the unusual threshold burial from Building 350 at Tel-Miqne-Ekron (above, n. 6) in a similar light.
Philistine and Canaanite or Israelite culture, as expressed by the biblical authors and which is gradually being deconstructed by archaeologists.

Ultimately, the Ashkelon infant burial and the iconography examined here may reflect the merger of the Egyptian and Mycenaean traditions in the economic, cultural, ethnic and religious marketplace that was Iron Age Ashkelon.
